

The fleet lens

Electric Vehicles deliver bottom-line benefits

Everlectric overview

Case studies based on.....

-  **+12 500 000 km** Travelled
-  **+2750 000 kg** of Carbon emissions saved
-  **100% operational EV availability,**
no downtime or mechanical issues

Some of the early adopters.....

Electric vehicles and charging equipment, fully managed and supported and via the **Cloud/app** with both **onsite and offsite support**.

Overcoming industry challenges

Current limitations in SA

Lack of EV availability / alternatives – limited choice

Infrastructure limitations – limited charging infrastructure

Grid stability and load shedding concerns

Prohibitive costs and expenses (vehicle capex, government duties, charging infrastructure)

Limited viable options for reducing one's carbon footprint

Solution

Provide world class OEM EVs-as-a-Service (EaaS)

Source and install globally leading DC Fast Charging infrastructure at client sites for their fleets

Source renewable electricity and provide electricity for all your operational needs

Navigate the complexities and provide EVs-as-a-service, with a single, bundled monthly invoice

Vehicles that are more operationally efficient and uses clean energy

Resulting in

EV access with no high upfront EV CAPEX costs

No charger CAPEX cost, maintenance or repair costs

Reduced opex with increased savings

Reduced total cost of ownership, making EV access easy, convenient and affordable

Reduced CO₂ emissions – leading to a cleaner, more environmentally friendly and sustainable future

SINGLE INVOICE

TOTAL COST OF OWNERSHIP

Utilising EVs in commercial logistics is considerably more affordable than the comparable ICE equivalents due to the large operating efficiencies EVs offer

It is significantly more affordable to operate EVs in commercial logistics than the comparable ICE equivalents due to the large efficiencies EVs offer. The **efficiencies scale with the usage and kilometers covered**, noting that the cost **fuel comparison returns up to an 80% efficiency** alone. Considering efficiencies in isolation may be misleading - when comparing EVs to ICE vehicles it is **imperative to understand the total cost of ownership of the respective vehicles over the lifespan of the vehicles**.

A comparison in any other form results in a mismatch of information that typically is difficult to reconcile. **The mismatch is a function of two major drivers, the cost base (initial**

CAPEX investment) and the running cost (monthly fuel and OPEX cost) both being very different.

Compared to Internal Combustion Engines (ICE), Electric vehicles (EV's) are currently more expensive in terms of upfront capex, however, EV's are substantially less expensive from an opex perspective.

To conduct an accurate comparison, a total cost of ownership (TCO) analysis needs to be done over the useful life of both vehicle types with cost indicators illustrated in the table.

Comparative **TCO savings up to 15% in normal operating conditions** with saving scaling considerably at higher rates.

Traditional ICE vs EV Equivalent				
	ICE	EV	Comment	Incl. TCO
Incl. TCO Vehicle cost	Lower	Higher	EV Higher initial cost including duties	✓
Charger Initial cost	Zero	Moderate	Investment in EV charging infrastructure	✓
Useful Life	Lower	Higher	EV projected to have +2X useful life of ICE	✓
Residual value	Lower	Higher	EV longer life + battery has high resale value	✓
Fuel/Electricity	Higher	Lower	EV R/km is ~80% cheaper than ICE	✓
Maintenance	Higher	Lower	EV projected to save +30% ICE	✓
Sundries (tires/telematics etc)	Estimated Same	Estimated Same	Projected to be equal	✗

EV costs are expected to decrease in the short term. Updated pricing from the vehicle manufacturers showing how **EVs have decreased year on year**. This will decrease the premium to the ICE equivalent price range and increase TCO savings.

Additional savings are possible given as EV costing and efficiencies continue to improve, with significant savings expected from 2025 technology

TOTAL COST OF OWNERSHIP (TCO): EVS VS ICE VEHICLES (DIRECT PURCHASE)

While the capital required for an EV is higher than an ICE, the TCO is lower for an EV because of the higher operational costs of an ICE – primarily due to fuel costs

Note: Comparison between Maxus eDeliver3 & Isuzu D-Max Gen 6, Residual Value: 30%, Time frame: 5 years, Mileage: 240 000 km, Insurance: 3.5% (decrease Y2: 17%. Y3-5: 12%), Fuel & inflation: 6%, Electricity inflation: 10%, Service & Maintenance (EV: R0.41/km, ICE: R0.76/km), Tyre Maintenance (EV: R0.22/km, ICE: R0.17/km), Fuel (EV: R0.45/km, ICE: R2.41/km), Prices are ex-VAT.

TOTAL COST OF OWNERSHIP (TCO): EVS VS ICE VEHICLES (FINANCED)

The TCO for an EV remains lower than an ICE even when the vehicle is financed

Note: Comparison between Maxus eDeliver3 & Isuzu D-Max Gen 6, Interest: 12%, Residual Value: 30%, Time frame: 5 years, Mileage: 240 000 km, Insurance: 3.5% (decrease Y2: 17%. Y3-5: 12%), Fuel & inflation: 6%, Electricity inflation: 10%, Service & Maintenance (EV: R0.41/km, ICE: R0.76/km), Tyre Maintenance (EV: R0.22/km, ICE: R0.17/km), Fuel (EV: R0.45/km, ICE: R2.41/km), Prices are ex-VAT.

2025 cost comparison EV vs ICE vehicles

If we re-baselined on 2025 costs drivers (see assumptions) and the EV costs (POC data) the incumbent ICE total costs hit a cross over point at ~3200km where it is more affordable to operate EVs within the fleet than all different ICE 1-ton vehicles

Fully maintained lease (FML) cost of ICE competitors	
Make, Range, Model	TOTAL FMR RENTAL excl. GPS excl. VAT
Isuzu D-Max 1.9 Ddi Hr L S/C P/U	R 8 203.40
Isuzu D-Max 250 Fleetside	R 7 811.48
Toyota Hilux 2.4 Gd A/c	R 7 993.27

Variable cost drivers (2025 re-baselined)	
Monthly Km's	2000-6000
Average Fuel Cost per Km	R 2,20
Fuel Price (Zar)	R 22,50
Electricity KWh	R 3,30
Additional KM charge*	R 0,50
Fuel Price Increase	8%
Electricity Increase	15%
Inflation	5%

Cost comparison EV vs ICE vehicles – R22/l

If we re-baselined on 2025 costs drivers (see assumptions) and the EV costs (POC data) the incumbent ICE total costs hit a cross over point at ~2500km where it is more affordable to operate EVs within the fleet than all different ICE panel vans

ICE 4 tonner Type vs EV 4 tonner type - R22/l

Fully maintained lease (FML) cost of ICE competitors

Make, Range, Model	TOTAL FMR RENTAL excl. GPS excl. VAT
ISUZU TRUCKS N SERIES NQR 500 F/C	R 17 198
UD TRUCK 4 ton	R 18 214
HINO 300 SERIES 916 LWB	R 18 643

Variable cost drivers (2025 re-baselined)

Monthly Km's	2000-6000
Average Fuel Cost per Km	R 4,55
Fuel Price (Zar)	R 22,00
Electricity KWh	R 3,00
Additional KM charge*	R 0,50
Fuel Price Increase	8%
Electricity Increase	15%
Inflation	5%

Cost comparison EV vs ICE vehicles – R22/l

If we re-baselined on 2025 costs drivers (see assumptions) and the EV costs (POC data) the incumbent ICE total costs hit a cross over point at ~2500km where it is more affordable to operate EVs within the fleet than all different ICE panel vans

ICE 8 tonner Type vs EV 8 tonner type - R22/l

Fully maintained lease (FML) cost of ICE competitors

Make, Range, Model	TOTAL FMR RENTAL excl. GPS excl. VAT
Isuzu FTR 850	R 37 487
Hino 500 Series	R 38 499
UD Croner PKE250	R 41 998

Variable cost drivers (2025 re-baselined)

Monthly Km's	2000-6000
Average Fuel Cost per Km	R 6,41
Fuel Price (Zar)	R 22,00
Electricity KWh	R 3,00
Additional KM charge*	R 0,50
Fuel Price Increase	8%
Electricity Increase	15%
Inflation	5%

EV vs Hyundai i10 Cargo Cost Benefit Analysis (2026 data)

Based on the cost benefit analysis it is viable to convert all **Hyundai i10 Cargo's** that travel **2685 km** or more a month to BYD Dolphin Surfs

ICE Cost = 2.56X + 3447.15

EV Cost = 0.77799*Vehicle KMs + 8230.797

Breakeven at: 2685 KMs

Oil price sensitivity

The below graphs depicts the sensitivity of the diesel price on the total cost of ownership of a typical diesel 4-ton vehicle against a 4-ton Electric truck
